

Gershman Acoustics a world leader in advanced High End Speaker Design is launching a new, revolutionary product

LVC- levitation Vibration Control

Before we explain how the LVC works, please let us reveal how the LVC came about:

The reason that the designers at Gershman Acoustics created some of the best speakers in the world is because of their love for music, relentless pursuit of quality, perfection and their ability to listen. Gershman Acoustics was able to eliminate the imperfections that came from the speakers, but still some other imperfections in the sound were apparent. Those imperfection came from the electronics. As good as the electronics were, they were still placed on a surface that would vibrate. As the music fills the room, the room get pressurized and depressurized from the sound waves. This affect every side of the electronics component evenly but does not detract from the sound quality, however what does affect the quality of the sound, is the asymmetrical vibrations that emanates from the floor and travels all the way up to the electronic equipment. In order to prevent this vibration from happening, Gershman Acoustics have developed the **LVC- Levitation Vibration Control**. The LVC uses repelling magnets and other materials with anti vibration properties to completely suppress the asymmetrical vibration

What can you expect when using the LVC:

***Smoothness of the sound.** The LVC clears out any artificial edginess that was not produced by the original musical instrument while maintaining its brilliancy, without rolling off the high frequencies, therefore, improving details throughout the frequency spectrum including the bass, the latter which will be more defined and tuneful.

*** Better details, and more definition in the lower frequencies.**

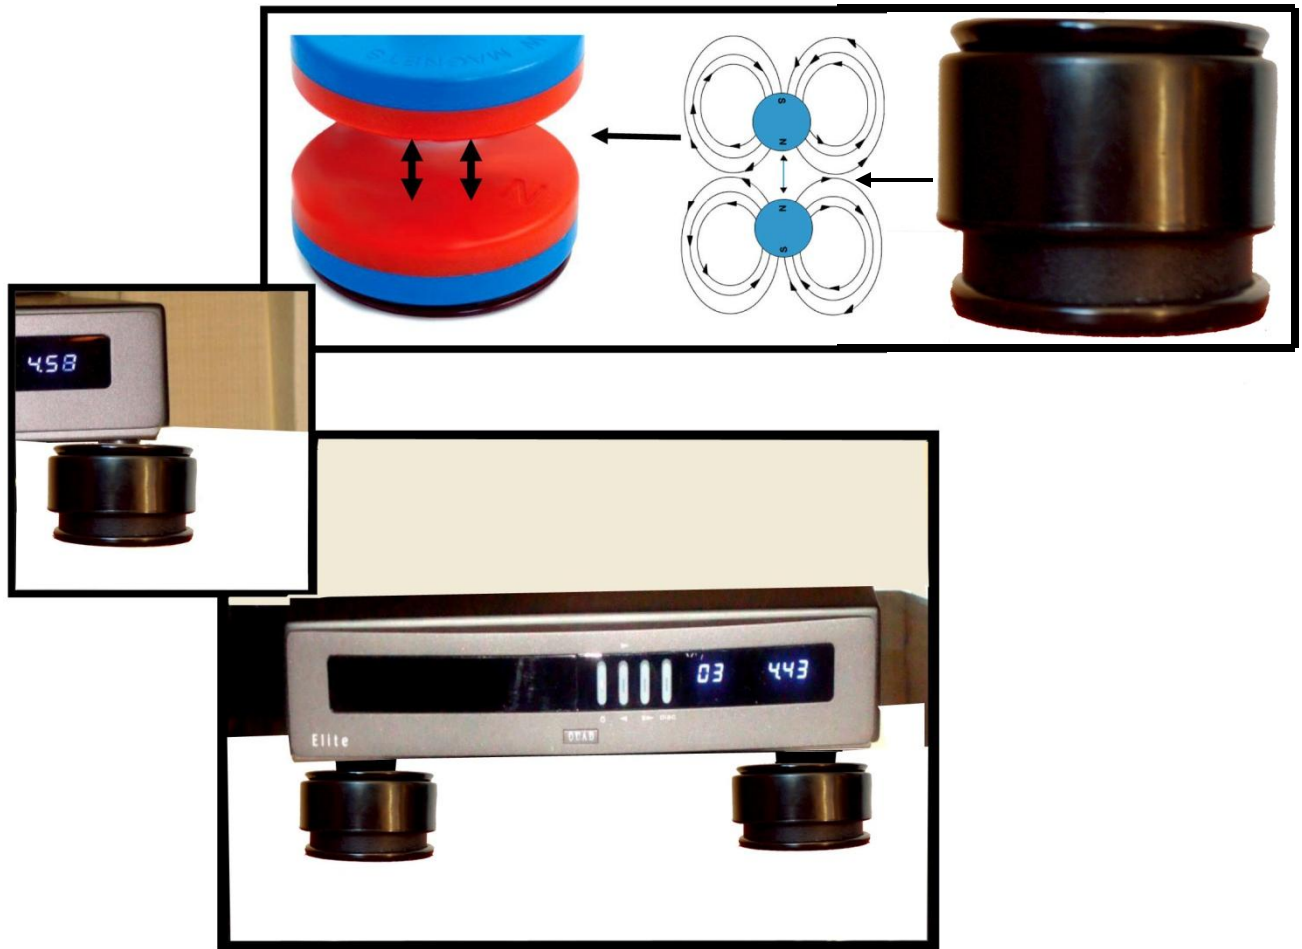

***Imaging and soundstage are greatly improved** as well as the musicality of the entire system.
